

Big Business Opportunity, Small Business Price

Small enterprise businesses can now take advantage of the latest VoIP technology by utilizing an existing Internet connection to provide a high-quality voice solution. VoX supports the 8-port Linksys SPA8000 ATA router which will give your business toll-quality voice and carrier-grade features. All they need is a broadband connection to the Internet and they're ready to go! Installation is a snap. Once the SPA8000 is installed by the enterprise business, the service is remotely provisioned, configured, and maintained by VoX.

Linksys SPA8000 Benefits:

- Remote provisioning
- Secure profile upload
- Encryption-based security
- Compatible with common telephony equipment (ie, standard telephone and fax machines, PBX systems and interactive voice response systems)
- Excellent voice quality

Here's How It Works

The SPA8000 is a dynamic adapter that will allow up to 8 analog lines with all of the features of a single line ATA. It comes with 8 RJ11 ports and requires only a single Internet feed. In addition, the unit has an RJ21 Amphenol connection that resembles a Centrix plug. This can feed out to a PBX unit so all of the PBX features remain active.

One of the smartest functions of the SPA8000 hosted by VoX is the hunting feature. If a call is being received while someone is already on an active phone line, the system will "hunt" for the next available or routed line so that a phone call is never missed. Not only will your company be able to take advantage of the latest technology in communications, you can realize the voice quality and cost savings of this small business solution offered by VoX.
